

# SHOTGRID

## Resource Planning Views in ShotGrid

ShotGrid brings more powerful production tracking capabilities to studio workflows with new Resource Planning views. Producers and Managers can now quickly identify where Artists are overloaded or underutilized across the studio and easily rebalance work to optimize team performance. This new workflow leverages live data in ShotGrid, allowing studios to react more quickly to the dynamic nature of production and confidently deliver work on time and on budget.

## What's New in ShotGrid

### Easily Compare the Capacity and Workload of Artists

The new high-level view provides an overview of your studio's Artist capacity and workload across all projects and departments. Easily see when and where Artists can take on more work or when they have been assigned too much and drill down into the details with only a few clicks.

### View by Departments or Projects

Dynamic Department and Project views provide a breakdown of Artist resources and the work assigned. Visualize the data by departments across all projects with the Department View, or by each individual project and their departments with the Project view.

### Quickly Rebalance Overbooked and Underutilized Artists

Dive into detailed views of an individual department or project and quickly identify Artists who are over or underutilized. Easily pull up an overview of a given Artist's assigned tasks and adjust task assignments and schedules with live data in just a few clicks.

### Customizable Workflows

With robust customizing capabilities, you can tailor your views and data for your unique studio needs. You can select custom start and end time ranges and analyze your data in a variety of chart types, configure how Workload is calculated and what it represents, and adjust the capacity on each person, including contracted time —providing studios with more flexibility.
