

# **Unified SASE**

What is it? And why do you need it?

# >> The unified SASE difference

Tackle today's networking challenges with a single-vendor security solution that evolves secure connectivity.

# **Secure Access Service** Edge (SASE) SD-WAN + Secure Service Edge

(SSE=ZTNA, SWG, CASB, and DEM)

# unified SASE

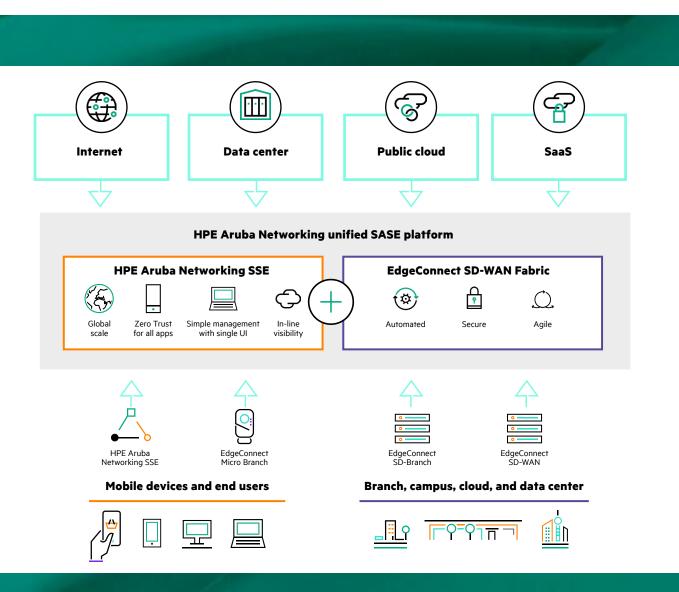

**HPE Aruba Networking** 

SD-WAN integrated into a single-vendor solution

## >> Single-vendor SASE evolves secure connectivity Improve simplicity, operational efficiencies, user experiences, and cost savings with

- consolidated, secure, anywhere connectivity to applications and data Overcome challenges of loosely integrated multiple point solutions, which can
- introduce latency, performance issues, and management overhead Enable greater agility and faster deployment, increasing time-to-value

## Today's network architects, IT leaders, and security professionals face significant challenges.

Why do you need SASE?

Hybrid working is the new norm Security perimeter is dissolving

- Most applications have moved to the cloud

### **Increased** High operational costs Poor user experience and risks and inefficiencies

Organizations are facing multiple issues

Internet users are prone

to web-based attacks

including ransomware

and phishing attacks

• The number of IoT devices has exploded increasing the attack surface

the infrastructure and resolving issues

troubleshoot.

Organizations spend

more resources and

time on managing

decreased productivity

• Poor user experience, affects performance, productivity, and satisfaction

leading to increased

latency, packet loss, and

bandwidth limitations

SASE solves these issues. And unified SASE simplifies the journey.

### for users, devices, and applications. Meet HIPAA/SOX standards, automate processes, reduce human error, and increase efficiency.

Unified SASE leverages identity-driven and granular Zero Trust access to grant least-privilege access

Least-privilege access with role and

user identification

Benefits of unified SASE

and data breaches Unified SASE protects against malicious web traffic by monitoring and inspecting all web traffic. It performs malicious code detection and web access control. It ensures sensitive data remains

protected and prevents data from being lost.

Protection against web-based threats

### **Built-in next-generation firewall increases** security in branch offices

The addition of NGFW to SD-WAN lets you safely remove physical firewalls and routers to reduce costs and your attack surface in branch offices.

### low-latency connection to applications and resources by dynamically selecting the

fastest connectivity path.

Intelligent routing improves application performance SD-WAN guarantees a secure, high-performance,

### **Enhanced scaling with virtual deployment** Quickly adapt to changing business needs to support digital transformation initiatives such as hybrid work, cloud migration, edge computing, IoT, and OT initiatives. Virtual deployment means no more need to buy hardware to support your network.

### Ideal gateway for small edge/branch sites The new EC-10104 branch gateway platform

is a cost-effective solution for small edge/ branch sites. Typical WAN bandwidth capacity ranges from 2-500Mbps and supports up to 100Mbps of WAN optimization.

# Flexible licensing lets you right-size your

and needs

unified SASE solution to fit your business, with the freedom to adapt over time. This makes SASE available at a significantly lower entry point—one that challenges other vendors.

For businesses the size of yours, a single-

vendor solution makes good sense. Get a single,

Flexible licensing suits your budget

tightly integrated platform that connects and protects your network, plus simplified management and administration.

Single-vendor simplicity

Make the right purchase decision. Contact our presales specialists.
