

Defend Against Threats

With Cisco Secure Remote Worker

Christine clicks on an email link with information about crime rates in her neighborhood but doesn't realize it's a malicious campaign to install malware on her machine.

But luckily, since her employer secured Christine's laptop with a **first line of defense**, the domain was blocked, preventing Christine from connecting to the site.

If the malware HAD gotten in, it would have spread to other devices, expanding the impact to her colleagues and company network.

But because Christine's employer also has **advanced malware protection**, malware would have been detected right away and isolated on her machine.

The advanced security would have identified everyone else who's been affected by that same malware—and then remediate the issue for all users immediately, with one click.

Cisco Umbrella and **AMP for Endpoints** defend workers against malware from the cloud edge to the endpoint.

Cisco security is backed by the largest non-government threat intelligence organization on the planet—blocking 20x more threats than any other vendor.
