

Assess platform health, reduce risk and improve identity-based access outcomes.

Health Check for Cisco ISE

Cisco ISE is a foundational platform for identity-based network access control. Over time, environments can drift from best practices due to policy changes, aging certificates, patch gaps and operational complexity. CDW's Health Check for Cisco ISE reduces audit risk, streamlines policy management, supports zero trust and segmentation, and helps prevent outages by proactively identifying configuration, certificates and system health issues.

Finding the Right Solution

The Health Check for Cisco ISE helps customers validate their overall ISE platform health, identify configuration drift or outdated policies, and confirm the environment supports current security requirements and user-access needs.

The health check assesses three core areas:

- System health, patching, certificates and admin access.
- Authentication and authorization policy structure.
- Profiling, guest, posture, TrustSec and segmentation readiness.

Typical findings from the health check include:

- Policy complexity that is hard to scale or troubleshoot.
- Aging certificates, patch gaps or inconsistent admin controls.
- Underused features that could improve visibility and enforcement.
- Authentication failures, device access issues or administrative complexity.

Following the health check, customers receive the following deliverables:

- A current-state assessment and summary of key risks.
- Prioritized recommendations based on impact and effort.
- Clear next steps to stabilize, optimize or expand capabilities.

CDW's Health Check for Cisco ISE reduces security and operational risk before issues affect users or audits and improves user and device onboarding by resolving friction points. The health check provides customers with a roadmap to optimize investment and support future initiatives.

CDW + CISCO

CDW brings more than 20 years of experience delivering Cisco solutions to enterprise, commercial and public sector customers. As a single, trusted provider, CDW offers one of the broadest and deepest Cisco practices in the industry, with expertise spanning multiple technologies and environments. Recognized as Cisco's Global and Americas Security Partner of the Year for 2025, CDW pairs award-winning credentials with a team of Cisco-certified engineers and architects.

Who needs the Health Check for Cisco ISE?

The Health Check for Cisco ISE is a good fit for customers with the following challenges:

- Customers who have not reviewed ISE against best practices in the last 12 months.
- Customers who are seeing authentication failures, device access issues or admin complexity.
- Customers who want to support zero trust, segmentation or broader access modernization.

The Health Check for ISE helps these customers reduce audit risk, lower operational overhead, accelerate zero trust and segmentation initiatives, and avoid unplanned outages by identifying policy issues, misconfigurations, patching gaps, system health problems and opportunities to reduce complexity.

Contact your CDW account team to schedule a Health Check for Cisco ISE to baseline the environment and prioritize improvements.
