WINDOWS AUTOPILOT OVERVIEW

Windows 10 devices offer the modern hardware and software needed to take advantage of cloud-based deployment technologies. They are reliable, secure, and easy to deploy and manage. Windows 10 devices lead your transformation efforts, so you and your organization can experience the greatest return on your digital transformation experience.

KEY BENEFITS

• Autopilot allows you to configure and deploy your Windows 10 device over the Internet with no interaction from an administrator or IT staff. It builds on existing modern management technologies like Azure Active Directory (AAD) and Mobile Device Management (MDM) to manage and configure your Modern Device by automatically enrolling the devices in these solutions at their first bootup, right out of the box.

• The resulting configuration is a deployment solution that can keep pace with dynamic modern environments that leverage the best of what Microsoft technologies like Microsoft 365 and Enterprise Management + Security can offer.

WHY TO CONSIDER WINDOWS AUTOPILOT

IT pros spend a lot of time building and customizing images that will later be deployed to devices and Windows Autopilot introduces a new approach:

From the user's perspective, it only takes a few simple operations to make their device ready to use.

From the IT pro's perspective, the only interaction required from the end user is to connect to a network and to verify their credentials. Everything beyond that is automated.
