

WE GET DEPLOYING TECHNOLOGY IS EXPENSIVE AND TIME-CONSUMING.

CDW Amplified™ Configuration
CDW Image Deployment Services

Let CDW help you build a turnkey deployment solution that reduces deployment time, increases your ROI, and frees your IT staff to focus on core business objectives. CDW's Software Installation services will allow you to purchase desktops, notebooks, tablets, thin clients and servers with your customized OS and/or software settings pre-configured prior to shipment. Eliminate the risk of DOA systems; malfunctioning hardware is replaced from CDW stock and 100% of imaged machines are validated by a QC manager before shipping to you. We can build any number of pre- and post-imaging tasks into your imaging workflow, as well as other popular services:

- Laser Etching | Asset Tagging | Data Capture | Palletization | Kitting and Special Packaging

CDW Image Deployment Services can help you achieve:

 Operational Efficiencies
  Reliability
  Increased Performance

Orchestrating the Right Solution

Standard (Static) Imaging: Reduce the time and expense needed to deploy images, install applications, and ready systems for end users by letting CDW do the work for you. This service deploys a static image and can be combined with pre- and post-imaging tasks to meet your custom requirements for each imaging project.

Advanced (Dynamic) Imaging: The service allows you to extend your existing desktop imaging environment to the CDW Configuration Center; this gives your team secure, direct and dynamic control over the entire deployment process. Your new equipment will be completely integrated into your environment, even considering application differences between divisions, all before shipping. Using our VPN service in conjunction with the image deployment solution, you can extend your network into our Configuration Center. This means that your machines will ship fully configured, saving time and resources needed to complete this task onsite. Your team will have the ability to modify the task sequence as needed, making any changes to the image process as your project evolves. We can host a virtualized VPN appliance and distribution point, or we can integrate your hardware devices.

Benefits of advanced deployment and advantages over static imaging include:

- Reduces license consumption by allowing software installation only to users who require it
- Allows for one universal image to have several different software configurations
- Provides automatically scheduled software deployment
- Facilitates joining a domain after Operating System Deployment (OSD) using task sequences

CDW's full lifecycle of Services can support your business no matter where you are on your journey

Proofpoints

CDW can help you deploy your critical IT equipment, helping to ease the burden on your staff:

30+

years of experience

300+

Technicians, engineers and team members

100%

QC validation
