WATCHGUARD THREATSYNC

DETECT EARLIER AND RESPOND FASTER TO THREATS WITH XDR

The increasing complexity of threats and the proliferation of security technologies can make it difficult for organizations to view their security posture comprehensively. At the same time, it is also challenging for overwhelmed security teams to combat advanced threats with limited visibility and disconnected security tools while dealing with slow detection times and trying to respond accurately. Today’s security experts need a unified security solution to identify, contain, and respond faster to emerging threats.

WatchGuard ThreatSync equips enterprises with XDR capabilities to centralize detections and orchestrate the response to threats from a single pane of glass. It simplifies cybersecurity while improving visibility and automating response actions across the organization faster, reducing risk and cost and providing higher accuracy.

PROACTIVE DEFENSE FOR EVOLVING CYBER THREATS

Extended Visibility
Build your XDR strategy with tight integrations and cross-domain data telemetry from WatchGuard’s latest-gen technologies. By broadening the range of data feeds from your growing security stack you have far greater visibility as well as stronger protection.

Early Detection
Move away from a siloed security approach and adopt threat intelligence detection coming from multiple sources. ThreatSync uses AI and ML technologies to identify potential threats in real time across multiple domains to reduce the mean time to detect (MTTD).

Faster Response
Put XDR into action and respond to threats in a flash. ThreatSync reduces mean time to respond (MTTR) by enabling automated response actions to neutralize threats across the enterprise in a simpler and faster process, reducing risk and offering higher accuracy.

WatchGuard ThreatSync puts security experts back in charge of their security stack with widely unified visibility, cross-detection, automated response to threats, and features suitable for any organization, regardless of budget, size, or complexity.

BENEFITS

Greater Visibility
into network and endpoint activity, helping to identify threats that might otherwise go undetected

Comprehensive Security
by unifying data and alerts into a single platform where solutions can work together to prioritize and respond to threats

Reduce Security Team Burdens
by automating the threat detection and response process and freeing up time and resources for security teams

Streamline Response Process
providing coordinated and automated responses to detected threats

No Added Costs to Access XDR
XDR is an essential tenet of modern cybersecurity that should be accessible to every business. As such, WatchGuard includes ThreatSync at no additional cost.
EXPERIENCE A UNIFIED XDR-BASED APPROACH

ThreatSync is part of WatchGuard’s Unified Security Platform architecture, the cornerstone on which to effectively build and evolve your security environment. It’s designed to simplify security visibility across an organization’s entire ecosystem. This enables security professionals to be more proactive against advanced cyber threats by providing them with a series of coordinated detection and response features.

Unified Threat Visibility

ThreatSync gathers and displays cross-detections from computers, servers, and firewalls in a single interface without admins needing to learn and use multiple consoles. This enables them to enjoy a consolidated user experience while gaining context of detections and stopping advanced threats faster to reduce security risks.

Unified Threat Detection

ThreatSync correlates operations automatically and related activities from individual security layers working in concert to alert admins of any suspicious activity. Then, it scores and detects malicious scenarios that could be indicators of compromise (IoCs), enabling MTTD reduction and swift containment of the impact, severity, and scope.

Unified Automated Response

When security experts have the information they need, it is easy to respond quickly. ThreatSync enables IT and security teams to work more efficiently since it provides the ability to schedule, automate, or run on-demand response actions to threats faster across the enterprise from a single pane of glass.

Security Orchestration

Combine security orchestration and automated response to provide an organization with a more comprehensive and cohesive security posture. ThreatSync integrates data and alerts from multiple domains, generates incident context, and streamlines the response process to enable security teams to respond more quickly and effectively to threats.

KEY FEATURES

- Increase accuracy and speed up detection with unified threat visibility by automatically consolidating threat data from the whole security stack.
- Uncover threats earlier with unified threat detection by correlating feeds monitored from different security sources to decrease MTTD.
- Reduce both alert fatigue and MTTR through unified automated response and alert scoring, avoiding manual interaction.
- Empower the coordination and automation of multiple processes and tools with security orchestration to provide a cohesive security posture.

The figures above show incident and threat details, the endpoint and network involved, incident timeline, and response actions available.
